## INSTRUCTION MANUAL AND PARTS LIST

## DESCRIPTION

Magnetrol's displacement type level switches offer the industrial user a wide choice of alarm and control configurations. Each unit utilizes a simple buoyancy principle and are well suited for simple or complex applications, such as foaming or surging liquids or agitated fluids, and usually cost less than other types of level switches.

## OPERATING PRINCIPLE

## Standard controls

Operation is based upon simple buoyancy, whereby a spring is loaded with weighted displacers which are heavier than the liquid. Immersion of the displacers in the liquid results in buoyancy force change, which moves the spring upward. Since the spring moves only when the level moves on a displacer, spring movement (1) is always a small fraction of the level travel between displacers (2).
A magnetic sleeve (3) is connected to the spring and operates within a non-magnetic barrier tube (4). Spring movement causes the magnetic sleeve to attract a pivoted magnet (5), actuating a switch mechanism (6) located outside the barrier tube. Built-in limit stops, prevent over stroking of the spring under level surge conditions.

## Proof-er controls

The purpose of the proof-er is to check the operation of a displacer control without having to raise the level in the tank. This is accomplished by pulling downward on the proof-er chain. This causes the spring loaded lever arm to lift the switch actuator, simulating a high or high high level condition. When the chain is released, the proof-er returns the actuator to its previous position to resume normal operation.

## Proof-er floating roof controls

The proof-er roof top control is designed for installation on 'barrier' (floating roof) tanks. The control may be furnished with a lead displacer to prevent sparking. A stainless steel displacer is required if the control is to actuate in liquid as well as by the barrier.

## MODEL IDENTIFICATION

## A complete measuring system consists of:

1. Code for standard models (each unit is factory calibrated to operate on a given specific gravity within the min and the max values listed per model) or
2. Code for floating roof models.
3. Code for standard displacer switches

BASIC MODEL NUMBER

- units for ALARM use ONLY

| A | 1 | 5 | One adjustable set point (fixed narrow differential) |
| :--- | :--- | :--- | :--- |
| B | 1 | 5 | Two adjustable set points (fixed narrow differentials) |
| C | 1 | 5 | Three adjustable set points (fixed narrow differentials), specify specific gravity of medium separately |

- units for ALARM/PUMP control use

| A | 1 | 0 | One adjustable wide differential |
| :--- | :--- | :--- | :--- |
| B | 1 | 0 | Two adjustable wide differentials, specify operating sequence and specific gravity separately (see p. 11 \& 12) |
| C | 1 | 0 | Three adjustable wide differentials, specify operating sequence and specific gravity separately (see p. 11 \& 12) |

## UNPACKING

Unpack the instrument carefully. Make sure all components have been removed from the packing material. Inspect all components for damage. Report any concealed damage to the carrier withing 24 hours. Check the contents of the packing slip and report any discrepancies to the factory. Check the nameplate model number to be sure it agrees with the packing slip and purchase order. Check and record the serial number for future reference when ordering parts.

CAUTION: If re-shipping to another location, displacer assembly must again be secured using same strap and wire assembly.

After unpacking, inspect all components to see that no damage has occurred during shipment.

These units are in conformity with the provisions of:

1. Directive 2014/34/EU for Equipment or protective system for use in potentially explosive atmospheres. EC-type examination certificate number ISSeP01ATEX027X (intrinsic safe units) or ISSeP09ATEX024X (Ex d units).
2. The PED directive 2014/68/EU (pressure equipment directive). Safety accessories per category IV module H1.

## HANDLING

CAUTION: The threaded connection link protruding from the head assembly is extremely fragile. DO NOT handle or place in a position such that any amount of force is placed on the stem. Proper operation of the control requires that the stem is not damaged or bent.

## MOUNTING

CAUTION: Displacer spring and stem are fragile. Do not drop displacers into tank. Hand feed cable into position to avoid bending stem.

Adjust the displacers on the displacer cable for the desired switch actuating levels. (Instruction tag attached to cable.) Screw displacer cable fitting to threaded connection link protruding from the underside of control.
Be sure there are no tubes, rods, or other obstacles in the tank or vessel to interfere with the operation of the displacers. No guides into the tank are necessary unless liquid turbulence is excessive, in which case a "guided pipe" or tube should be at least 25 mm larger than the displacer diameter, open at the bottom end and with several vent holes located above the maximum high level of the liquid. Check installation of pipe or tube to be certain it is plumb.

IMPORTANT: Before attaching Magnetrol control to tank or vessel, check with level to see that tank mounting flange or spud is horizontal. Proper operation of the control depends on the switch housing being plumb.

## WIRING

NOTE: If control is equipped with pneumatic switch mechanism, disregard these instruction and refer to instruction bulletin on mechanism furnished for air (or gas) connections.

Most Magnetrol control switch housings are designed to provide $360^{\circ}$ positioning of cable entry by loosening the set screw(s) located under the housing base. Diagrams of the control's internal electrical circuits (switching action between terminals) will be found in the switch mechanism instruction bulletin included.
On high temperature applications [above $120^{\circ} \mathrm{C}\left(250^{\circ} \mathrm{F}\right)$ ] high temperature wire should be used between control and first junction box located in a cooler area. Supply wires (conductors) are brought into the switch housing, wrapped around the enclosing tube under the baffle plate and then brought up to the proper terminals. Excess wire should be positioned so as not to interfere with switch mechanism or housing cover.
Some controls are furnished with an explosion proof (cast) switch housing or a vapor tight (gasketed) type. These housings are used in hazardous locations or when liquid temperature is so low that excessive condensation and frosting of switch parts is likely. After wiring connections have been completed, explosion proof housings must be "sealed" at the conduit outlet with suitable compound or "dope" to prevent entrance of air. Check cover to base fit on explosion proof and vapor tight housings to be certain gasketed joint is tight. A positive seal is necessary to prevent infiltration of moisture laden air or corrosive gases into switch housing.
Connect power supply to control and test switch action by varying liquid level. If switch mechanism fails to function, check vertical alignment of control and consult installation bulletin on mechanism furnished.

## Cast iron

- ATEX

CAUTION:

- DO NOT attempt to reposition cast aluminium housings without loosening the set screws; cast iron ATEX housings MAY NOT BE REPOSITIONED. ALWAYS retighten the set screw(s) after repositioning.
- DO NOT attempt to unscrew the cover of ATEX flameproof housings before loosening the locking screw. ALWAYS retighten the locking screw after replacing the cover.

## PREVENTIVE MAINTENANCE

If the following sections on "What to do" and "what to avoid" are observed, your Magnetrol instrument will operate reliably.

## WHAT TO DO

## 1. Keep control clean

Be sure the switch housing cover is always in place on the control. This cover is designed to keep dust and dirt from interfering with switch mechanism operation. In addition, it protects against damaging moisture and acts as a safety feature by keeping bare wires and terminals from being exposed. Should the housing cover become damaged or misplaced, order a replacement immediately.
2. Inspect switch mechanisms, terminals and connections monthly

- Dry contacts switches should be inspected for excessive wear on actuating lever or misalignment of adjustment screw at point of contact between screw and lever.
Such conditions can cause false switch actuating levels. Adjust switch mechanism to compensate (if possible) or replace switch.
DO NOT operate your control with defective or maladusted switch mechanisms (refer to bulletin on switch mechanism furnished for service instructions).
- Magnetrol controls may sometimes be exposed to excessive heat or moisture. Under such conditions, insulation on electrical wires may become brittle, eventually breaking or peeling away. The resulting "bare" wires can cause short circuits. Check wiring carefully and replace at first sign of brittle insulation.
- Vibration may sometimes cause terminal screws to work loose. Check all terminal connections to be certain that screws are tight. Air (or gas) operating medium lines, subjected to vibration, may eventually crack or become loose at connections causing leakage. Check lines and connections carefully and repair or replace, if necessary.

## WHAT TO AVOID

1. NEVER leave switch housing cover of the control longer than necessary to make routing inspections.
2. NEVER use lubricants on pivots of switch mechanisms. A sufficient amount of lubricant has been applied at the factory to insure a lifetime of service. Further oiling is unnecessary and will only tend to attract dust and dirt which can interfere with mechanism operation.
3. NEVER attempt to make adjustments or replace switches without reading instructions carefully. Certain adjustments provided for in Magnetrol controls should not be attempted in the field. When in doubt, consult the factory or your local Magnetrol representative.
4. NEVER attempt to readjust magnetic attraction sleeves which are factory set. Tampering may cause failure of control while in service even though manual operation actuates switches.

## TROUBLESHOOTING

Usually the first indication of improper operation is failure of the controlled equipment to function-pump will not start (or stop), signal lamps fail to light, etc. When these symptoms occur, whether at time of installation or during routing service thereafter, check the following external causes first.

- Fuses may be blown.
- Reset button(s) may need resetting.
- Power switch may be open.
- Controlled equipment may be faulty.
- Stem may be bent causing hang-up.
- Wiring (or medium lines) leading to control may be defective.

If a thorough inspection of these possible conditions fails to locate the trouble, proceed next to a check of the control's switch mechanism.

1. Pull disconnect switch or otherwise assure that electrical circuit(s) through the control is deactivated.
2. Remove switch housing cover.
3. Swing magnet assembly in and out by hand, checking carefully for any sign of binding. Assembly should require no force, however slight, to move it through its full swing.
4. If binding exists, magnet may be rubbing enclosing tube or pivot sockets may be overly tight. Readjust pivot sockets as required until a slight amount of side play is evident. If magnet is rubbing, loosen magnet clamp screw and shift magnet position.
5. If switch magnet assembly swings freely and mechanism still fails to actuate, check installation of control to be certain it is within the specified three $\left(3^{\circ}\right)$ degrees of vertical (use spirit level on side of enclosing tube in two places, $90^{\circ}$ apart).

NOTE: As a matter of good practice, spare switches should be kept on hand at all times.

If switch mechanism is operating satisfactorily, a test of the complete control's performance is the next likely step.

1. Reconnect power supply and carefully actuate switch mechanism manually (using a non-conductive tool on electrical switch mechanism) to dertermine whether controlled equipment will operate.

CAUTION: With electrical power "on" care should be taken to avoid contact with switch leads and connections at terminal block
2. If controlled equipment responds to manual actuation test, trouble may be located in level sensing portion of the control (displacers, spring, stem and magnetic attracting sleeve.

NOTE: Check first to be certain liquid is entering tank or vessel. A valve may be closed or pipe line plugged.
3. With liquid in tank or vessel, proceed to check level sensing action by removing switch housing assembly.

CAUTION: Be certain to pull disconnect switch or otherwise assure that electrical circuit(s) through control is deactivated. Close operating medium supply valve on controls equipped with pneumatic switch mechanisms.
A. Disconnect wiring from supply side of switch mechanism(s) and remove electrical conduit or operating medium line connections to switch housing.
B. Relieve pressure from tank or vessel and allow unit to cool.
C. Remove switch housing assembly by loosening set screw located immediately below housing base.
4. With switch housing assembly removed, inspect attracting sleeve and inside of enclosing tube for excessive corrosion or solids build-up which could restrict movement, preventing sleeve from reaching field of switch magnet.
5. If trouble is still not located, proceed to remove the entire sensing unit from the tank or vessel by unbolting head flange or unscrewing mounting bushing. Inspect displacer assembly and all internal parts for any signs of damage. Check assembly for binding by supporting head flange or mounting bushing over the edge of a bench and move displacer assembly by hand.

NOTE: When in doubt about the condition or performance of a Magnetrol control, return it to the factory. See "Our Service Policy" on page 16.

Partn ${ }^{\circ}$ :

Digit in partn ${ }^{\circ}$ :

Serial $\mathrm{n}^{\circ}$ :

See nameplate, always provide complete partn ${ }^{\circ}$ and serial $\mathrm{n}^{\circ}$ when ordering spares.

## CAUTION:

Location of magnetic sleeve(s) must be maintained for proper switch actuation. Do NOT attempt to alter differential of control by repositioning jam nuts.

Typical single switch model (threaded connection)

Typical dual switch model (flanged connection)

Typical model with Proof-er and floating roof displacer (threaded connection)

Typical model with Proof-er and floating roof displacer (flanged connection)

Notes

Notes

## IMPORTANT

## SERVICE POLICY

Owners of Magnetrol products may request the return of a control; or, any part of a control for complete rebuilding or replacement. They will be rebuilt or replaced promptly. Magnetrol International will repair or replace the control, at no cost to the purchaser, (or owner) other than transportation cost if:
a. Returned within the warranty period; and,
b. The factory inspection finds the cause of the malfunction to be defective material or workmanship.

If the trouble is the result of conditions beyond our control; or, is NOT covered by the warranty, there will be charges for labour and the parts required to rebuild or replace the equipment.
In some cases, it may be expedient to ship replacement parts; or, in extreme cases a complete new control, to replace the original equipment before it is returned. If this is desired, notify the factory of both the model and serial numbers of the control to be replaced. In such cases, credit for the materials returned, will be determined on the basis of the applicability of our warranty.
No claims for misapplication, labour, direct or consequential damage will be allowed.

## RETURNED MATERIAL PROCEDURE

So that we may efficiently process any materials that are returned, it is essential that a "Return Material Authorisation" (RMA) form will be obtained from the factory. It is mandatory that this form will be attached to each material returned. This form is available through Magnetrol's local representative or by contacting the factory. Please supply the following information:

1. Purchaser Name
2. Description of Material
3. Serial Number and Ref Number
4. Desired Action
5. Reason for Return
6. Process details

Any unit that was used in a process must be properly cleaned in accordance with the proper health and safety standards applicable by the owner, before it is returned to the factory.
A material Safety Data Sheet (MSDS) must be attached at the outside of the transport crate or box.
All shipments returned to the factory must be by prepaid transportation. Magnetrol will not accept collect shipments.
All replacements will be shipped Ex Works.

[^0]:    ${ }^{(1)}$ For applications with heavy vibration, consult factory for suited switch modules.
    ${ }^{(2)}$ Max process temperature is specified at $40^{\circ} \mathrm{C}\left(100^{\circ} \mathrm{F}\right)$ ambient temperature and for non condensing applications.
    ${ }^{(3)}$ For more details - see bulletin BE 42-120.
    ${ }^{(4)}$ For condensing applications, max process temperature is down-rated to $200^{\circ} \mathrm{C}\left(400^{\circ} \mathrm{F}\right) @ 40^{\circ} \mathrm{C}\left(100^{\circ} \mathrm{F}\right)$ ambient.
    ${ }^{(5)} \mathrm{Q}$ and O are the equivalent switch modules for models C10/C15.

[^1]:    (1) Consult factory for high temperatures.
